

View of the roof from above —

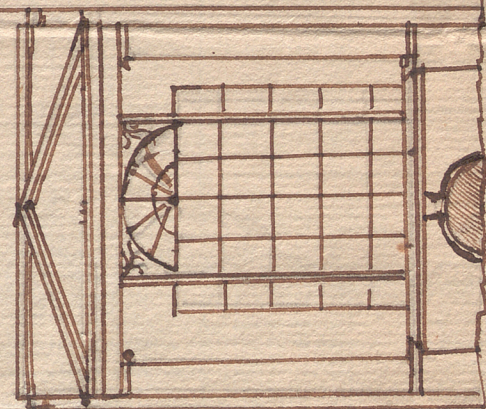

The building has four pediments, the west one against the wall of the Phila delphia Library. The water therefore will fall off at the four corners —

The skylight is proposed to pursue the inflexions of the roof. The circular piece within the middle to be left by way of strengthening the roof. If rendered concave within & painted white it will neither offend the eye nor diminish the light.

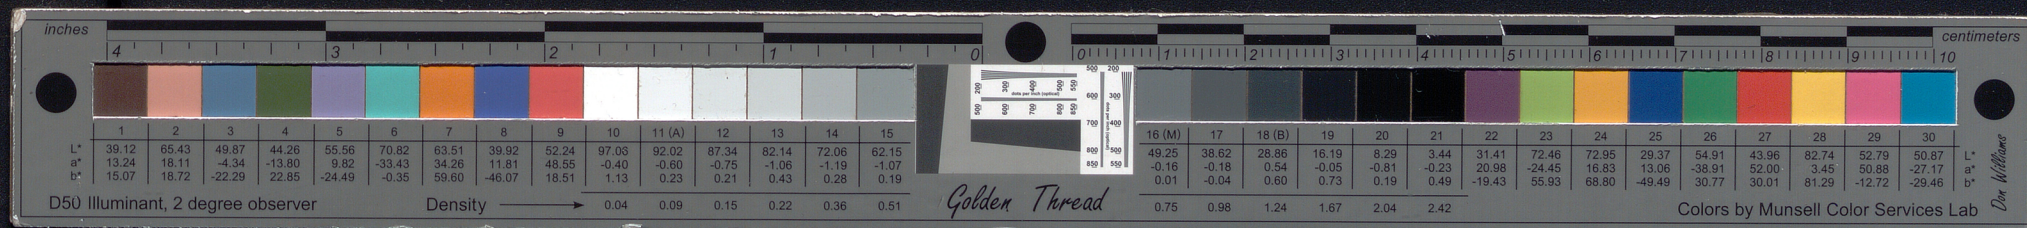

The sashes must be of metal and if neatly & strongly made the weather will have no access —

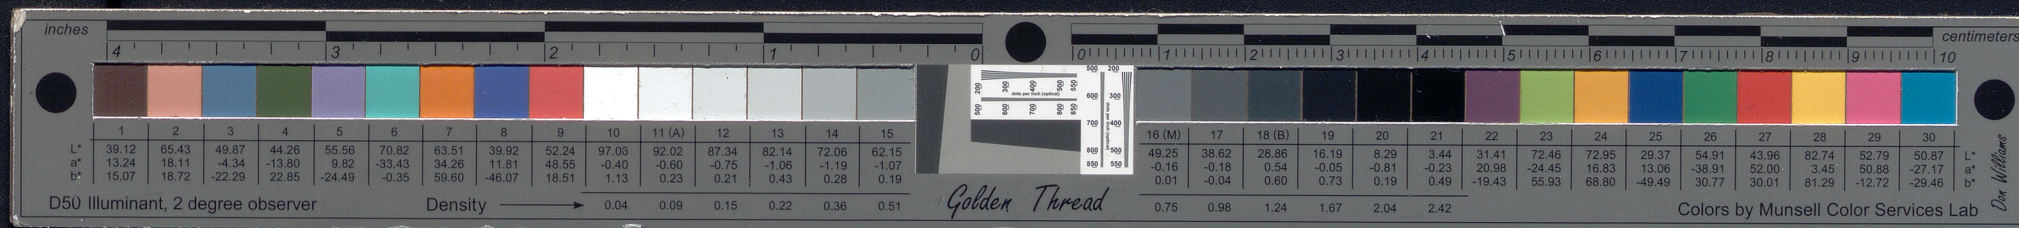

East side

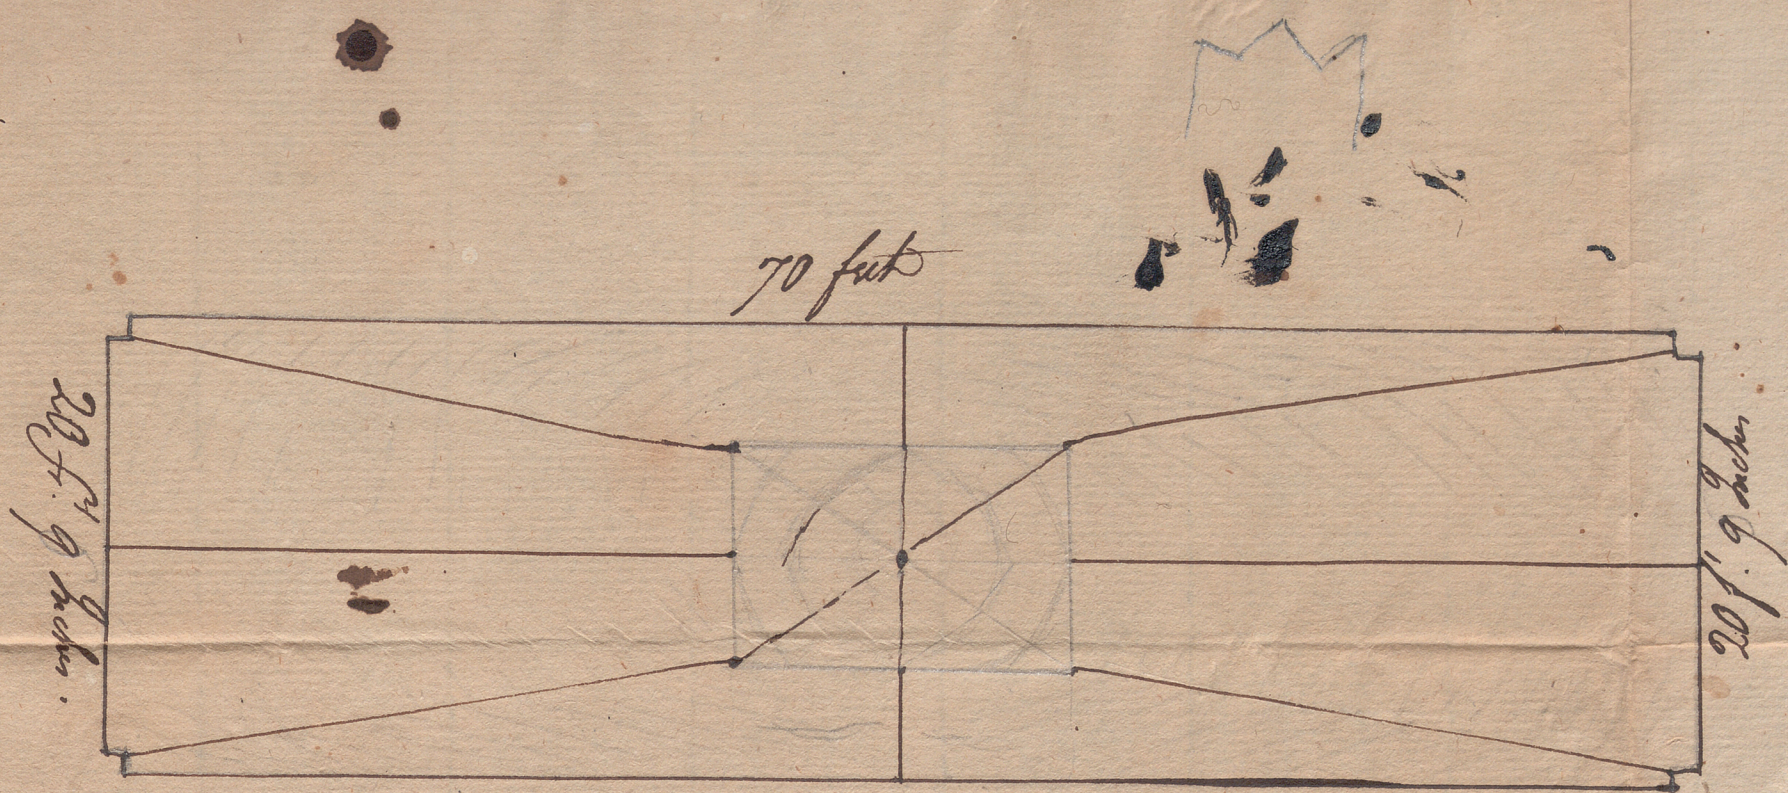

North & South Sides alike

— View of the Roof from Above —

By this Plan the Building will have four Pediments. The Frame of the Sky-light to be supported by the four Hip-rafter & then to be strengthened by the Jack-Rafter. The Sky-light will be horizontal; or as nearly so, as the necessary fall for the Water will admit. The Sashes may be either Oval or in the form of an Oblong, ^{square} if the Ceiling of the Room is concave, the Light will immediately enter without the intervention of a Well.
